APPENDIX A - Act 296, SLH 1983	
APPENDIX B - "Preliminary Geothermal Assessment Surveys for the State of Hawaii"	

## INTRODUCTION

Act 296, SLH 1983, relating to geothermal energy was signed into law on June 14, 1983 by Governor George R. Ariyoshi.

The Board of Land and Natural Resources is charged with the responsibility of designating geothermal resource subzones in the State of Hawaii. Once subzones are established, all geothermal activities including the exploration, development, production and distribution of electrical energy may be conducted only in the designated geothermal resource subzones.

This Plan of Study outlines the implementing strategy of the Department of Land and Natural Resources in designating geothermal resource subzones in the State of Hawaii.

## STUDY OBJECTIVES AND SCOPE

The objective of the study is to designate geothermal resource subzones in the State of Hawaii for the purpose of concentrating all geothermal related activities in areas having minimum social, economic, environmental, and hazard impacts. To the extent provided by Act 296, SLH 1983, all existing statutory, ordinance, and rules are to be respected and are not superseded by this effort.

The State of Hawaii will be reviewed for geothermal resource potential and assessments will be conducted for each island and presented on a county-by-county basis as provided by Act 296, SLH 1983.

HIGHLIGHTS OF ACT 296, SLH 1983

- Amends Chapter 205, Land Use Commission
- Provides for the designation of Geothermal Resource Subzones in each of the four State land use districts--conservation, agriculture, urban, and rural.
- Geothermal resource exploration, development, production, and distribution of electrical energy may be conducted only in designated geothermal resource subzones.
- The Board of Land and Natural Resources is charged with the responsibility of designating geothermal resource subzones.
- The Board of Land and Natural Resources shall adopt administrative rules to designate geothermal resources subzones.
- The administration of the use of subzones for exploration, development, production and/or distribution of electrical energy shall be governed as follows:
  - \* BLNR for conservation districts.
  - \* Existing State and County laws for agricultural, urban, and rural districts.
- No land Use Commission approval is necessary for the use of subzones.
- Provides for contested case hearing. Upon request, the hearing shall be conducted by the BLNR or County agency prior to the issuance of a geothermal resource permit.
- The BLNR beginning in 1983 shall conduct a county-by-county assessment of potential geothermal resource development areas. The assessment shall be revised or updated at the discretion of the BLNR once every 5 years beginning in 1988.
- Any property owner may petition the BLNR to have an area designated as a geothermal resource subzone.
- An EIS is not required for the assessment of areas.
- The assessment of potential geothermal resource subzones shall examine factors to include but not be limited to:
  - \* Potential geothermal energy production.
  - \* Use of the geothermal energy in the area.
  - \* Geologic hazards.

- \* Social and environmental impacts.
  - \* Compatibility with present and planned use.
  - \* Potential economic benefits.
  - \* Compatibility with conservation principles where a subzone falls within a conservation district.
- The assessment may be based on currently available public information.
  - The BLNR shall propose potential areas for designation based upon assessment factors and hold public hearings in close proximity to the proposed area. The hearings shall be held before the Board and not be conducted by any agent or representative.
  - At the close of the hearing, the BLNR may designate the subzones. Upon request, the BLNR shall issue its findings and principal reasons for its decision.
  - Designated areas may be withdrawn by the BLNR.
  - The Act shall not apply to active exploration, development, or production of electrical energy taking place on the effective date of the Act. Expansion of such activities however are subject to the provisions of the Act.
  - The Governor signed Act 296 into law, effective June 14, 1983.

## STUDY APPROACH

Based upon the provisions of Act 296, SLH 1983, the following four-phase study approach has been developed for designating geothermal resource subzones.

### Phase I. Statewide Geothermal Resource Assessment

This phase will focus upon geotechnical information, its interpretation and analysis of potential geothermal resources on all of the major islands. Due to the time constraint of completing the work by December 1984, available studies will be heavily used with minimal new studies and data gathering. First-cut subzones based only on the availability of geothermal resources will be mapped to conclude Phase I work.

### Phase II. Social, Economic, Environmental, and Hazard Impact Analysis

Impact analysis of social, economic, environmental, and hazard will be conducted on the first-cut subzones completed in Phase I. Several disciplines are expected to participate in this phase. Overlay mapping of the impacts will be extensively used to identify highly sensitive impact areas. Adjustments to the first-cut subzones will be made to conclude Phase II work.

### Phase III. Public Participation and Information

This phase will extensively involve communities located in close proximity to the identified subzones. Informational meetings will be conducted to explain the technical work and the impact analyses. Comments from the public will be solicited and the further adjustments to the subzone are expected to be made.

### Phase IV. BLNR Designation of Geothermal Resource Subzones

This phase is expected to involve the Board of Land and Natural Resources. Briefing sessions will be conducted by the staff on both the technical analysis and the impact analysis. Public input will be described and documented.

The BLNR is expected to hold public hearings and formally designate the geothermal resource subzones.

## STUDY MANAGEMENT AND BUDGET

### Lead Agency and Study Participants

Act 296, SLH 1983, designated the Board of Land and Natural Resources with the responsibility for designating geothermal resource subzones. The Chairperson has assigned the subzone task to the Division of Water and Land Development (DOWALD) and has designated the Division's Manager-Chief Engineer as the principal contact person.

Other offices within the Department of Land and Natural Resources identified to assist DOWALD in their respective functional areas are:

- \* The Deputy to the Chairperson - coordination
- \* Division of Land Management - leasing of state geothermal resources
- \* Planning Office - management of conservation district lands

### Role of Other Agencies

1. Hawaii Institute of Geophysics (HIG), University of Hawaii

The HIG has technical expertise on its staff and has completed preliminary assessments of geothermal resource in the State of Hawaii. This available information and expertise will be utilized by DLNR for the assessment phase. Under HIG, the resource and production data for the existing HGP-A geothermal well will be made available for the assessment work.

2. Department of Planning & Economic Development (DPED)

The Energy Division has made available \$50,000 for use by DLNR in the subzoning work. Arrangements are being made for DLNR to use the funds. DPED also has a resource library on geothermal resource development. This information will be made available for the subzoning.

3. Department of Health (DOH)

The Health Department is expected to establish odor and noise standards and to promulgate these requirements into Administrative Rules for implementation. Impact analysis relating to the health of people will be based upon available standards or guidelines.

4. State Land Use Commission (LUC)

Land use activities on agricultural district lands of at least 15 acres or more in size require State Land Use Commission approval. The administration of subzones designated on these lands will involve the LUC.

5. County Planning Departments

Agricultural, urban, and rural district lands are administered by the County Planning Departments. As such, geothermal development activities within designated subzones would require County zoning approvals prior to implementation.

6. Puna Geothermal Resource Developers

Currently, two private developers are actively engaged in the exploration of geothermal resource in the Puna area. The Puna Joint Venture (Thermal Power Co., Amfac, Dillingham) and Barnwell Corporation have developed information and may be willing to share their information and expertise with the State in subzoning assessment activities.

Schedule for Designating Subzones

The overall time schedule for completing the work is estimated to be December 1984. The critical dates and actions are identified below:

Action	1983						1984											
	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
● Plan of Study . . .	█																	
● Available information assessment. . . .			█															
● Administrative Rules . . . . .				█														
● <u>Assessment of geothermal areas.</u>				█			█											
● Impact analysis . . .							█			█								
● Public participation. . . . .										█								
● Designation by BLNR . . . . .													█			█		

Budget

In enacting Act 296, SLH 1983, the Legislature did not provide funds for implementation. The Department nonetheless selected Act 296 as a high priority DLNR program for implementation for Fiscal Year 1983. Existing staff is being utilized on a part-time basis to develop a strategy for implementation and to lay the groundwork for full implementation.

Fiscal Year 1983-84

A \$50,000 budget has been made available by DPED and arrangements are being made to fully utilize this fund for F.Y. 1983-84 activities. The breakdown of expenditures are listed below:

Hire full-time Geologist I @ \$1800.00 (SR-24)	
October 1983 - June 1984 (9 months) . . . . .	\$16,200.00
Fringe benefits (25%) . . . . .	4,000.00
Other miscellaneous expenses (travel, supplies, etc.) . . . . .	2,000.00
Information gathering, including mapping . . . . .	2,000.00
Promulgation of Administrative Rules . . . . .	2,500.00
Assessment of Geothermal Areas, \$2000/mo. x 6 . . . . .	12,000.00
Impact Analysis, \$3000 x 3 . . . . .	9,000.00
Public participation . . . . .	<u>2,300.00</u>
Total FY 1983-84 . . . . .	\$50,000.00

Fiscal Year 1984-85

Principal activities for FY 1984-85 involve the designation of subzones by the BLNR. Six months are allotted for this purpose at a budget of approximately \$5,000.00. This amount, together with funds for the employment of a Geologist I position has been requested in the FY 1984-85 Supplemental Budget. The details are listed below:

Personnel services . . . . .	\$20,897.00
Other current expenses . . . . .	8,400.00
Equipment . . . . .	<u>200.00</u>
Total FY 1984-85 . . . . .	\$29,497.00

## ADMINISTRATIVE RULES

Following is a preliminary outline of the Administrative Rules for the designation of geothermal resource subzones in the State of Hawaii. The legal authority is Act 296, SLH 1983.

### TITLE 13

#### DEPARTMENT OF LAND AND NATURAL RESOURCES SUB-TITLE 7. WATER AND LAND DEVELOPMENT

#### Chapter 184

#### Rules on Designation and Regulation of Geothermal Resource Subzones

#### Subchapter 1. General

- §13-184-1 Purpose
- §13-184-2 Definitions
- §13-184-3 Geothermal resource subzones
- §13-184-4 Effective date and applicability
- §13-184-5 Severability
- §13-184-6 (Reserved)
- §13-184-7 (Reserved)

#### Subchapter 2. Designation of Geothermal Resource Subzones

- §13-184-8 Procedures for designation
- §13-184-9 Initial and 5-year assessments by Board
- §13-184-10 Petition by landowner
- §13-184-11 Criteria for designation of subzones
- §13-184-12 Public hearings
- §13-184-13 Findings of fact report
- §13-184-14 Designation of subzones by Board
- §13-184-15 Amendment and withdrawal of subzones by Board

#### Subchapter 3. Regulation of Geothermal Resource Subzones

- §13-184-16 Geothermal Uses of subzones
- §13-184-17 Administration of subzones in Conservation Districts
- §13-184-18 Administration of subzones in Agricultural, Rural and Urban Districts
- §13-184-19 Application for permits to drill and test, use for injection, use for production, and abandon geothermal wells
- §13-184-20 Application for permits to construct and operate power plants and related facilities
- §13-184-21 Term of permits
- §13-184-22 Contested case hearings
- §13-184-23 (Reserved)
- §13-184-24 (Reserved)

Schedule for Adopting the Administrative Rules

<u>Item</u>	<u>Target Date</u>
First-cut review draft . . . . .	October 31, 1983
Agency reviews . . . . .	November 30, 1983
Public hearing draft . . . . .	December 31, 1983 ✓
Public hearings . . . . .	January, 1984
BLNR action . . . . .	February, 1984
Governor's action . . . . .	February, 1984

## ASSESSMENT OF AVAILABLE INFORMATION

A major task already underway is the search for available technical information. Principal agencies having geothermal related information include:

- \* Hawaii Institute of Geophysics
- \* DPED, Energy Division
- \* DLNR, Planning Office
- \* U.S. Geological Survey, Geologic Division

An example of geothermal surveys conducted to date include:

Preliminary Geothermal Assessment Surveys for the State of Hawaii.  
Donald M. Thomas, et al. (See Appendix B).

APPENDIX A

Act 296, SLH 1983

A BILL FOR AN ACT

RELATING TO GEOTHERMAL ENERGY.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF HAWAII:

1 SECTION 1. The legislature finds that the development  
 2 and exploration of Hawaii's geothermal resources is of  
 3 statewide concern, and that this interest must be balanced  
 4 with interests in preserving Hawaii's unique social and  
 5 natural environment. The purpose of this Act is to provide  
 6 a policy that will assist in the location of geothermal  
 7 resources development in areas of the lowest potential  
 8 environmental impact.

9 SECTION 2. Section 182-4, Hawaii Revised Statutes, is  
 10 amended to read as follows:

11 "§182-4 Mining leases on state lands. (a) If any  
 12 mineral is discovered or known to exist on state lands, any  
 13 interested person may notify the board of land and natural  
 14 resources of his desire to apply for a mining lease. The  
 15 notice shall be accompanied by a fee of \$100 together with a  
 16 description of the land desired to be leased and the  
 17  
 18

1 minerals involved and such information and maps as the board  
2 by regulation may prescribe. As soon as practicable  
3 thereafter, the board shall cause a notice to be published  
4 in a newspaper of general circulation in the county where  
5 the lands are located, at least once in each of three  
6 successive weeks, setting forth the description of the land,  
7 and the minerals desired to be leased. The board may hold  
8 the public auction of the mining lease within six months  
9 from the date of the first publication of notice or such  
10 further time as may be reasonably necessary. Whether or not  
11 the state land sought to be auctioned is then being utilized  
12 or put to some productive use, the board, after due notice  
13 of public hearing to all parties in interest, within six  
14 weeks from the date of the first publication of notice or  
15 such further time as may be reasonably necessary, shall  
16 determine whether the proposed mining operation or the  
17 existing or reasonably foreseeable future use of the land  
18 would be of greater benefit to the State. If the board  
19 determines that the existing or reasonably foreseeable  
20 future use would be of greater benefit to the State than the  
21 proposed mining use of the land, it shall disapprove the  
22 application for a mining lease of the land without putting  
23 the land to auction.  
24  
25

1           The board shall determine the area to be offered for  
2           lease and, after due notice of public hearing to all parties  
3           in interest, may modify the boundaries of the land areas.

4           At least thirty days prior to the holding of any public  
5           auction, the board shall cause a notice to be published in a  
6           newspaper of general circulation in the State at least once  
7           in each of three successive weeks, setting forth the  
8           description of the land, the minerals to be leased, and the  
9           time and place of the auction. Bidders at the public  
10          auction may be required to bid on the amount of annual  
11          rental to be paid for the term of the mining lease based on  
12          an upset price fixed by the board, a royalty based on the  
13          gross proceeds or net profits, cash bonus, or any  
14          combination or other basis and under such terms and  
15          conditions as may be set by the board.

16          (b) Any provisions to the contrary notwithstanding, if  
17          the person who discovers the mineral discovers it as a  
18          result of exploration permitted under section 182-6, and if  
19          that person bids at the public auction on the mining lease  
20          for the right to mine the discovered mineral and is  
21          unsuccessful in obtaining such lease, that person shall be  
22          reimbursed by the person submitting the highest bid at  
23          public auction for the direct or indirect costs incurred in  
24

1 the exploration of the land, excluding salaries, attorney  
2 fee's and legal expenses. The department shall have the  
3 authority to review and approve all expenses and costs that  
4 may be reimbursed."

5 SECTION 3. Chapter 205, Hawaii Revised Statutes, is  
6 amended by adding new sections to be appropriately  
7 designated and to read as follows:

8 "§205- Geothermal Resource Subzones. (a)

9 Geothermal resource subzones may be designated within each  
10 of the land use districts established under section 205-2.

11 Only those areas designated as geothermal resource subzones  
12 may be utilized for the exploration, development,  
13 production, and distribution of electrical energy from  
14 geothermal sources, in addition to those uses permitted in  
15 each land district under this chapter.

16 (b) The board of land and natural resources shall have  
17 the responsibility for designating areas as geothermal  
18 resource subzones as provided under section 205- . The  
19 designation of geothermal resource subzones shall be  
20 governed exclusively by this section and section 205- ,  
21 except as provided therein. The board shall adopt, amend,  
22 or repeal rules related to its authority to designate and

1 regulate the use of geothermal resource subzones in the  
2 manner provided under chapter 91.

3 The authority of the board to designate geothermal  
4 resource subzones shall be an exception to those provisions  
5 of this chapter and of section 46-4 authorizing the land use  
6 commission and the counties to establish and modify land use  
7 districts and to regulate uses therein.

8 (c) The use of an area for the exploration,  
9 development, production and/or distribution of electrical  
10 energy from geothermal sources within a geothermal resource  
11 subzone shall be governed by the board within the  
12 conservation district and by existing state and county  
13 \* statutes, ordinances, and rules within the agricultural,  
14 rural, and urban districts, except that no land use  
15 commission approval shall be required for the use of  
16 subzones. The board and/or appropriate county agency shall,  
17 upon request, conduct a contested case hearing pursuant to  
18 chapter 91 prior to the issuance of a geothermal resource  
19 permit relating to the exploration, development, production,  
20 and distribution of electrical energy from geothermal  
21 resources. The standard for determining the weight of the  
22 evidence in a contested case proceeding shall be by a  
23  
24  
25

COUNTY PERMITS?

State

1 preponderance of evidence. Chapters 183, 205A, 226, and 343  
2 shall apply as appropriate.

3 §205- Designation of areas as Geothermal Resource  
4 Subzones. (a) Beginning in 1983, the board of land and  
5 natural resources shall conduct a county-by-county  
6 assessment of areas with geothermal potential for the  
7 purpose of designating geothermal resource subzones. This  
8 assessment shall be revised or updated at the discretion of  
9 the board, but at least once each five years beginning in  
10 1988. Any property owner or person with an interest in real  
11 property wishing to have an area designated as a geothermal  
12 resource subzone may submit a petition for a geothermal  
13 resource subzone designation in the form and manner  
14 established by rules and regulations adopted by the board.  
15 An environmental impact statement as defined under chapter  
16 343 shall not be required for the assessment of areas under  
17 this section.

18 (b) The board's assessment of each potential  
19 geothermal resource subzone area shall examine factors to  
20 include, but not be limited to:

21 (1) The area's potential for the production of  
22 geothermal energy;

23 (2) The prospects for the utilization of geothermal  
24 energy in the area;

1        (3) The geologic hazards that potential geothermal  
2            projects would encounter;

3        (4) Social and environmental impacts;

4        (5) The compatibility of geothermal development and  
5            potential related industries with present uses of  
6            surrounding land and those uses permitted under  
7            the general plan or land use policies of the  
8            county in which the area is located;

9        (6) The potential economic benefits to be derived from  
10           geothermal development and potential related  
11           industries; and

12       (7) The compatibility of geothermal development and  
13           potential related industries with the uses  
14           permitted under sections 183-41 and 205-2, where  
15           the area falls within a conservation district.

16       In addition, the board shall consider, if applicable,  
17       objectives, policies and guidelines set forth in part I of  
18       chapter 205A, and the provisions of chapter 226.

19       \* (c) Methods for assessing the factors in subsection  
20       (b) shall be left to the discretion of the board and may be  
21       based on currently available public information.

22       (d) After the board has completed a county-by-county  
23       assessment of all areas with geothermal potential or after  
24

\* IMPORTANT,  
ALWAYS  
INCLUDE  
IN REPORT

1 any subsequent update or review, the board shall compare all  
2 areas showing geothermal potential within each county, and  
3 shall propose areas for potential designation as geothermal  
4 resource subzones based upon a preliminary finding that the  
5 areas are those sites which best demonstrate an acceptable  
6 balance between the factors set forth in subsection (b).  
7 Once such a proposal is made, the board shall conduct public  
8 hearings pursuant to this subsection, notwithstanding any  
9 contrary provision related to public hearing procedures.

10 (1) Hearings shall be held at locations which are in  
11 close proximity to those areas proposed for  
12 designation. A public notice of hearing,  
13 including a description of the proposed areas, an  
14 invitation for public comment, and a statement of  
15 the date, time, and place where persons may be  
16 heard shall be published and mailed no less than  
17 twenty days before the hearing. The notice shall  
18 be published on three separate days in a newspaper  
19 of general circulation state-wide and in the  
20 county in which the hearing is to be held. Copies  
21 of the notice shall be mailed to the department of  
22 planning and economic development, and the  
23  
24  
25

1           planning commission and planning department of the  
2           county in which the proposed areas are located.

3           (2) The hearing shall be held before the board, and  
4           the authority to conduct hearings shall not be  
5           delegated to any agent or representative of the  
6           board. All persons and agencies shall be afforded  
7           the opportunity to submit data, views, and  
8           arguments either orally or in writing. The  
9           department of planning and economic development  
10           and the county planning department shall be  
11           permitted to appear at every hearing and make  
12           recommendations concerning each proposal by the  
13           board.

14           (3) At the close of the hearing, the board may  
15           designate areas as geothermal resource subzones or  
16           announce the date on which it will render its  
17           decision. The board may designate areas as a  
18           geothermal resource subzones only upon finding  
19           that the areas are those sites which best  
20           demonstrate an acceptable balance between the  
21           factors set forth in subsection (b). Upon  
22           request, the board shall issue a concise statement  
23  
24  
25

1           of its findings and the principal reasons for its  
2           decision to designate a particular area.

3           (e) The designation of any geothermal resource subzone  
4           may be withdrawn by the board of land and natural resources  
5           after proceedings conducted pursuant to the provisions of  
6           chapter 91. The board shall withdraw a designation only  
7           upon finding by a preponderance of the evidence that the  
8           area is no longer suited for designation, provided that the  
9           designation shall not be withdrawn for areas in which active  
10           exploration, development, production or distribution of  
11           electrical energy from geothermal sources is taking place.

12           (f) This Act shall not apply to any active  
13           exploration, development or production of electrical energy  
14           from geothermal sources taking place on the effective date  
15           of the Act, provided that any expansion of such activities  
16           shall be carried out in compliance with its provisions."

17           SECTION 4. Statutory material to be repealed is  
18           bracketed. New material is underscored.

19           SECTION 5. If any provision of this Act, or the  
20           application thereof to any person or circumstance is held  
21           invalid, the invalidity does not affect other provisions or  
22           applications of the Act which can be given effect without  
23  
24  
25

1 the invalid provision or application, and to this end the  
2 provisions of this Act are severable.

3 SECTION 6. This Act shall take effect upon its  
4 approval.

5 Approved by the  
Governor on

PRELIMINARY GEOTHERMAL ASSESSMENT SURVEYS FOR THE STATE OF HAWAII

Donald M. Thomas, Malcolm E. Cox, Barry R. Lienert, James P. Kauahikaua, Mark D. Mattice

Hawaii Institute of Geophysics, Honolulu, Hawaii 96822

ABSTRACT

The Geothermal Resource Assessment Program of the Hawaii Institute of Geophysics has conducted a series of geochemical and geophysical surveys in ten separate locations within the State of Hawaii in an effort to identify and assess potential geothermal areas throughout the State. The techniques applied include groundwater chemistry and temperatures, soil mercury surveys, ground radon emanometry, time-domain electromagnetic surveys and Schlumberger resistivity soundings. Although geochemical and geophysical anomalies were identified in nearly all the survey sites, those areas which show most promise, based on presently available data, for a geothermal resource are as follows: Puna, Kailua Kona, and Kawaihae on the island of Hawaii; Haiku-Paia and Olowalu-Ukumehame canyons on Maui; and Lualualei Valley on Oahu. Further surveys are planned for most of these areas in order to further define the nature of the thermal resource present.

INTRODUCTION

The Hawaii Institute of Geophysics Geothermal Resource Assessment Program has conducted a series of geochemical and geophysical field surveys in ten prospective geothermal areas of the State of Hawaii to assess their potential. The exploration techniques which have been applied include groundwater chemistry, isotopic analysis, soil mercury and radon surveys, time-domain electromagnetic soundings, and Schlumberger resistivity surveys (Thomas et al., 1980). These surveys were conducted in areas selected from a state-wide assessment of all available data, including the likelihood of subsurface heat from geological criteria, regional geophysics and chemistry of groundwater (Thomas et al., 1979). The areas in which studies have been conducted (Figures 1, 2, and 3) are as follows:

On Hawaii: Kawaihae, Hualalai northwest rift, Kailua Kona, Mauna Loa southwest rift, Kilauea lower east rift, and Keaau;

On Maui: Kaanapali-Lahaina, Olowalu-Ukumehame and Haiku-Paia;

On Oahu: Lualualei Valley.

SUMMARY OF RESULTS

Kawaihae. Geochemical sampling in the Kawaihae area has delineated an east-west trending zone of anomalously high soil mercury concentra-

tions and ground radon emanation which correlate well with above ambient groundwater temperatures in the immediate vicinity. Groundwater chemistry, specifically Cl/Mg ratios, also indicate that the local groundwater chemistry may have been thermally altered.

Schlumberger resistivity soundings in the Kawaihae area suggest a highly resistive body to the northeast of the mercury and radon anomalies; this feature is interpreted to be a shallow intrusive body which may be associated with a nearby 80,000 year old eruptive vent (Malinowski, 1977).

Although these data indicate potential for low temperature geothermal prospects, further studies will be necessary before any estimate of the thermal potential can be made.

Hualalai Northwest Rift. Geochemical surveys on the northwest flank of Hualalai volcano yielded only very slight evidence of geothermal activity. Soil mercury concentrations and radon outgassing were relatively low throughout the region however slightly elevated mercury concentrations were found to be associated with the eruptive vents along the trend of the rift system; radon values were not significantly anomalous. There are few groundwater wells in this area and thus only two sets of chemical data are available; only one of these, to the south of the rift system, showed a significant Cl/Mg anomaly.

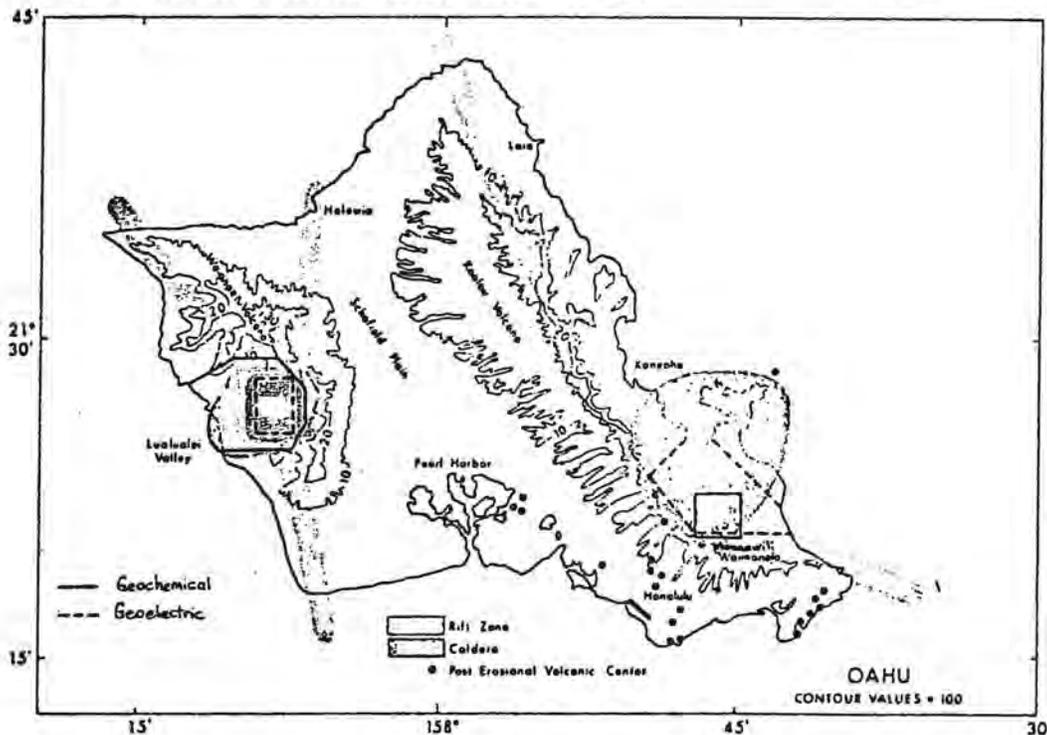

Schlumberger soundings along the rift were able to identify a conductive zone at 500 m depth near the summit of Hualalai; this anomaly has been interpreted to be associated with dike-impounded groundwater which may or may not be above ambient temperatures.

The presently available geochemical and geophysical data do not provide convincing evidence that a thermal anomaly is present in this survey area. However, the last eruptive activity on Hualalai took place in 1801 and it seems likely that this volcano could have some geothermal potential. Continued surveys are planned for Hualalai on a limited scale.

Kailua Kona. Geochemical surveys conducted in the north Kona district have identified several areas in which mercury and radon anomalies are

Fig. 3 Location of Survey Areas: Island of Oahu.

present. Groundwater Cl/Mg ratios are generally elevated for these areas as well. The general trend of the anomalous zones suggest that they arise from beneath the higher slopes of Hualalai. Geophysical surveys have not yet been conducted in this area, largely due to the extensive pipe networks and other cultural interferences.

Although the presently available data on this area are by no means conclusive, they strongly suggest that thermal anomalies are influencing groundwater chemistry and ground gas movement. Continued surveys will be conducted in this area in an effort to determine whether the origin of the observed anomalies is a local one or is deeper within Hualalai volcano.

**Mauna Loa Southwest Rift.** Surveys on the lower Mauna Loa southwest rift zone have been restricted to time-domain electromagnetic and Schlumberger resistivity soundings. Estimated resistivities were about 100 ohm-m, suggesting that there is little thermal activity in the immediate survey area.

**Keaau.** Geochemical and geophysical surveys in the Keaau area were unpromising in regard to geothermal prospects. Mercury and radon surveys showed only slight elevation above the natural background and groundwater chemistry suggested a simple mixing of minor amounts of saline water with local meteoric recharge. Schlumberger and time-domain soundings identified a thick freshwater lens but no anomalous conductors at depths less than 5 km over the entire survey region. Few, if any, geothermal surveys are anticipated for this district of Hawaii.

**Kilauea Lower East Rift.** Schlumberger and time-domain electromagnetic surveys were completed over several areas of the lower east rift zone of Kilauea in the vicinity of the geothermal well HGP-A. Analysis of the data indicates that this area has a substantially lower resistivity than any of the other surveyed sites studied and that the HGP-A reservoir is elongated along the strike of the east rift zone and extends to the southeast toward Kapoho (Kanahikaua et al., 1980). Radon and mercury surveys suggest an elongate rift-confined reservoir, with some broadening uprift of HGP-A.

**Lahaina-Kaanapali.** Water chemistry from several wells in the Lahaina-Kaanapali district shows slightly elevated Cl/Mg ratios suggesting that a low order thermal anomaly may be present in this area; mercury and radon results to some degree substantiate the groundwater data although the anomalies as presently defined are restricted to the immediate vicinity of Kaanapali and a post-erosional cinder cone northeast of Lahaina. Five resistivity soundings were conducted in this area. Resistivities in the order of 20 to 40 ohm-m are interpreted as seawater saturated basalt, which are typical for Hawaii (Mattice & Lienert, 1980).

Our preliminary assessment of this area is that a low temperature anomaly may exist which is associated with the Lahaina post-erosional volcanic centers. Further geochemical and geophysical surveys are currently being carried out to more clearly define the source of the observed anomalies.

**Olowalu-Ukumehame.** The chemical analyses of three wells in the area are considered anomalous, one having a temperature of 33°C and a Cl/Mg ratio of 17.7 [greater than 15 is considered anomalous for Hawaiian groundwater (Cox & Thomas, 1979)] and two having temperatures greater than 25°C. Soil mercury concentrations are low, but radon survey results show a low order anomaly. Schlumberger resistivity surveys in Olowalu-Ukumehame canyons have identified a conductive layer at a depth of 90 m to 200 m and having a resistivity of 4 ohm-m. These results suggest that the basalts beneath the survey area are saturated with hot seawater (Mattice & Lienert, 1980).

The presence of anomalous groundwater chemistry and resistivities in this area suggests that at least a low temperature thermal anomaly is present.

**Haiku-Paia.** Groundwater chemical analyses have delineated several areas in which Cl/Mg ratios are substantially higher than normal Hawaiian groundwaters. The highest ratios (21 and 58) are located in the north central corner of the survey area near the intersection of the northwest rift zone of Haleakala and the coast. Groundwater temperatures show a pattern quite similar to that of the Cl/Mg ratios although at higher elevations temperatures decrease, presumably due to the wells penetrating perched groundwater.

Both radon and soil mercury values substantiate the observed anomalous groundwater chemistry and temperature patterns. The highest soil mercury and radon values were found along the western boundary of the rift zone (Cox & Cuff, 1980).

The resistivity values measured in this area average around 10 ohm-m but cannot as yet be ascribed to thermal water and may result from high porosity basalts. It is believed that the very strong geochemical anomalies observed in this area arise from a thermal source associated with the Haleakala northwest rift system. Continued geochemical and geophysical surveys will be conducted in this area to further define the source of heat.

**Lualualei Valley.** Extensive geochemical surveys have been conducted in the area within and around Lualualei Valley (Cox et al., 1979). Groundwater chemistry data on several wells located near the inferred Waianae Caldera boundary exhibit very strong chemical anomalies: seven wells have temperatures in excess of 25°C, five wells have Cl/Mg ratios in excess of 15, and six wells have silica concentrations greater than 80 ppm. The groundwater chemistry anomalies are generally coincident with strong soil mercury concentrations and ground radon anomalies. Schlumberger soundings in the survey area have identified a dike impounded groundwater layer which appears to overlie basalt saturated with fresh to brackish warm water. This layer is in turn underlain by a highly resistive layer of basement rock which is interpreted to be the dense volcanic intrusive complex associated with the Waianae volcano caldera.

Our interpretation of the results of the geochemical and geophysical data obtained for Lualualei Valley is that residual heat is present within the Waianae Caldera system, probably at considerable depth, and that there is convective transport by groundwater through the fracture system associated with the collapsed caldera. Further geophysical studies and deep drilling will be necessary before estimates can be made of the temperature and depth of the heat source.

#### CONCLUSION

Our preliminary assessment of the areas presently under study is as follows:

**Kawahae:** low to moderate temperatures possibly associated with an ancient intrusion;  
**Hualalai Northwest Rift:** low temperatures may exist but there is presently insufficient data for a more definite appraisal;

**Kailua-Kona:** a strong indication that subsurface heat has influenced the groundwater chemistry, the source for these anomalies indicated to be below Hualalai volcano;

**Mauna Loa Southwest Rift:** no indication of any significant subsurface heat;

**Kilauea Lower East Rift:** surveys suggest that the reservoir tapped by the geothermal well HGP-A extends eastward along the rift zone toward Kapoho;

**Keau:** there is a very low probability for a thermal resource in this area;

**Wahina-Kaanapali:** surveys suggest that low order anomalous temperatures may be associated with the post erosional Lahaina volcanic vent system;

**Olowalu-Ukumehame Canyons:** available data have identified what is probably a low to moderate temperature thermal anomaly in Olowalu Canyon;

**Haiku-Paia:** very strong anomalies, apparently associated with the northwest rift of Haleakala, substantiate the presence of subsurface thermal conditions;

**Lualualei Valley:** a fracture-controlled low temperature thermal anomaly is indicated within the former Waianae caldera.
